Engine- Fox 15 BBRC Span-48" Length-32" Channels-Rudder, Elevator \& Throttle Tank- GP 4 ounce Prop-MAS $8 \times 3$ Battery- 600 Ma Servos-Standard

## Page 2

Things you will need to make this plane: Aluminum "U" channel, 2 mm Coroplast for the wing \& Amm Coroplast for the tail, two yardsticks for the spar, HDPE Wal-Mart cutting board for engine mount, sciap PVC gutterpipe for the control homs and tail mounting back plates, zip-ties and foam mounting tape for servo installation, small self tapping screws for engine mount and tail mounting, two pieces of scrap coat hanger, some foam, your radio and engine plus engine mounting bolts and nuts and pushrods, fuel tank, propeller, fuel tubing, rubber bands, and four 6.23 bolts and nuts for wing hold downs. You will also need a hack saw to cut the " U " channel and a drill with sharp drill bits for drilling through the aluminum. Also needed will be standard shop tools and a propane torch and Medium CA glue for wing building.

The engine mount is made from a Wal-Mart kitchen cutting board. One $\$ 5.00$ board will make a lot of engine mounts!

The fuselage is made out of aluminum "U"channel. It measures 3/4" on the bottom and $1 / 2^{\prime \prime}$ on the sides. It comes in 8 foot sections. We found ours at ACE Hardware Store for about \$10.00. Cut a 32" piece for your fuselage. brittle. We cut ours out on an band saw

## 2"

Cut out to the size of your engine

## 5"

## Fuselage

## Page 5

Make sure the middle engine mount screw sticks through the bottom of the HDPE far enough to be used as a fuel tank rubber band hold down.

Drill out the engine mount and install your engine with bolts and nuts. Brill 3 evenly spaced holes in the fusleage, and install the eagine mount wih Seli tapping screws. We used $\# 6 \times 3 / 4^{\prime \prime}$ sgrews. You dont rven need pilot holes Make sure the engithe is, straight!

Make the Horizontal Stabilizer/Elevator out of 4 mm Coroplast with these dimensions. Just cut out one side of a flute for the hinge.

Hinge Line
2"
14"

Make the Vertical Stabilizer/Rudder out of $4 \mathbf{m m}$ Coroplast to these dimensions and make the hinge the same way you did for the elevator by cutting out one side of a flute.

## Hinge Line

Page7

## Page 8

Drill holes in the aluminum fuselage for the tail mount screws like you

\#6 $\times 1 / 2^{\prime \prime}$ self tapping screws were used to mount the tail and they are screwed into $3 / 4^{\prime \prime}$ square PVC gutterpipe scraps. Also use the $3 / 4$ " square PVC for the control horn back plates. Make the pilot holes in the PVC very small so the screws will hold real well. Make sure the hinges clear the aluminum channel right on the edge.

The control horns are made from PVC gutterpipe and are $1^{\prime \prime}$ high by $1^{\prime \prime}$ long by $1 / 2^{\prime \prime}$ wide base. Clean the parts and use drops of CA to hold them in place so adding the screw is easier. Extra screws that come with Dave Brown engine mounts make perfect control horn screws.

You will make the spar from 2 yardsticks. You will cross them like this picture and glue them together. This will make a very strong "lap" joint. Then you will cut off the extra where the red line is on the picture. Make sure that there is $24^{\prime \prime}$ from the center of the spar to each end, this will give you a 48" spar. We built this wing with $8^{\prime \prime}$ of dihedral. See page 12 for how to measure the dihedral.

We buy our yardsticks from LOWES and they are in the paint department. Try to be real picky and get ones that are not warped.

This is how you measure the dihedral. With one side of the spar on the flat edge of the table, the other side is set to $8^{\prime \prime}$ from the edge of the table. You can see the yellow ruler used at the end of the spar. We got the spar all lined up and measured, then marked and cut the extra off, and then glued them together and clamped the "lap" joint down, using the ruler to make sure it was right.

One of our work tables is an old door. This is perfect for building Spad wings:
if you have a rag handy and wipe oifthe tip of your glue bottr EVERY time you use it, It will revered cogged up

Page 13 score the leading edge with a small phillips screwdriver and a straight edge. $\mathbf{2 m m}$ Coroplast will fold real easy after a couple firm passes with the screwdriver.

This is what you need for gluing Coroplast. First Clean it. Then "Flame" it with a propane torch. Then apply a water mist to one side and Medium CA glue to the other side of the glue joint. It should set up in less than 30 seconds when using water mist. You can use a bead of glue when gluing the wooden spar to the Coroplast, but when gluing Coroplast to Coroplast ONLY USE A SMALL drop about every half an inch. If you use too much glue it will not set up. For the wing you are about to build, you can use two rows of glue dots for the trailing edges. When you "flame" the Coroplast, get the torch close and move very fast. It's ok to wrinkle the Coroplast a little because the glue joints are on the inside of the wing anyways. "Flaming"

Clean and flame the

## 

Trim the
excess trailing edge from the top panel to be flush with the bottom trailing edge and your wing is half done!

Now your ready to do the other half of the wing. First glue the spar down. Then test fold the top wing panel and you will notice that part of the center will need to be trimmed away so it will fit nicely. Don't worry about making it pretty because you will be covering it with the center wrap a little later.

Glue the wing wrap to the center of the wing starting from the trailing edge on the bottom, around the leading edge then to the trailing edge on top. It helps to crease it in the middle to better fit the wing contour. Dont forget to clean, flame and use only glue
For rubberband dots with the water mist. protection, slide a Once on, trim trailing piece of scrap coat edge flush. hanger in wing wrap trailing and leading edge flute.

## Page 25

The fuel tank is rubberbanded in place on top of a piece of foam. Use the protruding middle engine mount screw as the tank rubberband hold down.
MAS $8 \times 3$ prop

Use double sided foam mounting tape on the bottom of the throttle servo and press it into the rail. Also use a zip-tie for added security. Notice I used a plastic tube around the throttle pushrod. The fuel tank rubberbands give perfect support for this.

Page 27

The receiver is zip-tied to the rail. Drill a hole in the rail behind the receiver and use fuel tubing to route the antenna through. You can see a small scrap servo arm used on the antenna as a stress point in case of a mid-air or dirt-nap.

Page 28

Use double sided foam mounting tape on the bottom of the servos and press them into the rail. Also use zip-ties for added security. Rig the elevator for at least $1^{\prime \prime}$ travel each way ( 2 " total) and rig the rudder for as much throw as you physically can (Barn door).

Your wing chord is $8^{\prime \prime}$ and yet you should make sure your hold down bolts are 9 " apart. This will help prevent rubberband crush at the wing's leading and trailing edge.
Use tape or rubberbands to temporarily install wing to fuselage. Postition wing for proper balance. Mark 1R" from LE and TE for bolt locations

Page 30 under the spar at each wing tip. Make sure EVERYTHING is ready to fly and the fuel tank is empty for balancing. Once you have determined the position of your wing, drill holes and install the 6-32 hold down bolts and nuts. this by making the wing mount to
fuselage wherever it needs to be this by making the wing mount to
the fuselage wherever it needs to be so that the plane balances perfectly level when you pick it up with a finger tip directly

## Page $31 \approx$ Flying Sassy's Rudder Kail

This airplane is very stable and grooves very well. As with all rudder airplanes, there is a slight hesitation and tail was from the time you move the stick to the time the airplane begins to turn, so be very carefull not to over control. This is true especially during launch, $H_{2}$ or you might find yourself upside down and crashing. If you are new start with. If you get disoriented all you have to do is let go of the sticks, count to two
 and then gently pull up... This airplane will right itself and get you right back in the fight! This airplane would also make a VERY GOOD budget trainer with a good instructor. Please follow all AMA safety guidelines! (Use at least 12 ( 6 per side) $A 6+$ rubberbardetio hold the wing an and 3 for the tank. Make sure the propeller stops horizon ff or dead stick landings! HAVE F (IN!! www-spadtothebore.com
